Java Syntax

In the previous chapter, we created a Java file called `Main.java`, and we used the following code to print "Hello World" to the screen:

Main.java

```
public class Main {  
    public static void main(String[] args) {  
        System.out.println("Hello World");  
    }  
}
```

[Try it Yourself »](#)

Example explained

Every line of code that runs in Java must be inside a `class`. In our example, we named the class **Main**. A class should always start with an uppercase first letter.

Note: Java is case-sensitive: "MyClass" and "myclass" has different meanings.

☐ Dark mode

above on your computer, make sure that Java is properly installed: Go to the [Get Started Chapter](#) for how to install Java. The output should be:

```
Hello World
```

The main Method

The `main()` method is required and you will see it in every Java program:

```
public static void main(String[] args)
```

Any code inside the `main()` method will be executed. Don't worry about the keywords before and after main. You will get to know them bit by bit while reading this tutorial.

For now, just remember that every Java program has a `class` name which must match the filename, and that every program must contain the `main()` method.

System.out.println()

Inside the `main()` method, we can use the `println()` method to print a line of text to the screen:

```
public static void main(String[] args) {  
    System.out.println("Hello World");  
}
```

Try it Yourself »

Note: The curly braces `{ }` marks the beginning and the end of a block of code.

`System` is a built-in Java class that contains useful members, such as `out`, which is short for "output". The `println()` method, short for "print line", is used to print a value to the screen (or a file).

Don't worry too much about `System`, `out` and `println()`. Just know that you need them together to print stuff to the screen.

You should also note that each code statement must end with a semicolon (`;`).

Test Yourself With Exercises

Exercise:

Insert the missing part of the code below to output "Hello World".

```
public class MyClass {  
    public static void main(String[] args) {  
        . . . ("Hello World");  
    }  
}
```
