Java Print Variables

‹ Previous

Display Variables

The `println()` method is often used to display variables.

To combine both text and a variable, use the `+` character:

Example

```java
String name = "John";
System.out.println("Hello " + name);
```

Try it Yourself »

You can also use the `+` character to add a variable to another variable:

Example

```java
String firstName = "John ";
String lastName = "Doe";
```

☐ Dark mode

Try it Yourself »

For numeric values, the `+` character works as a mathematical <u>operator</u> (notice that we use `int` (integer) variables here):

Example

```java
int x = 5;
int y = 6;
System.out.println(x + y); // Print the value of x + y
```

Try it Yourself »

From the example above, you can expect:

- x stores the value 5
- y stores the value 6
- Then we use the `println()` method to display the value of x + y, which is **11**
